Low Carb High Fat Bread: Gluten- and Sugar-Free Baguettes, Loaves, Crackers, and More

The highest concentrations of the peptide were found in the adrenal medullae, cardiac atria, and lungs 2627whereas the highest concentrations of ADM mRNA were measured in the lungs, cardiac atria, aorta, and mesenteric arteries ADM exerts its

effects by ligation of receptor complexes consisting of the calcitonin receptor-like receptor CRLR combined with a specific receptor activity-modifying protein RAMP

36Interaction of ADM with its receptor occurs through its C-terminal moiety 45and the N-terminal part of ADM is thought to be only of minor importance for its agonist function

Circulating ADM has a half-life of approximately 22 min 47 and is rapidly degraded from its N-terminus by proteases 48 - On a more organ-specific level, the lungs appear to be involved as a site of clearance 53As mentioned before, the first discovered physiological effect of ADM was vasodilation, leading to hypotension and reduced peripheral resistance 12 - Over the following years, many studies have confirmed these results.
